Statement of Significance

Last updated on - June 24, 1999

David V Isaacs, a consulting engineer, designed this air raid shelter for the owner, Mrs Sicree in December 1940. Construction began in February 1941. The builders were Pollard Brothers.

Research has clearly established that the Sicree shelter is not typical of those structures commonly constructed in great numbers by citizens in their backyards after 1941. The shelter is unusual for its very early date, the sophistication of its engineering and for the lack of soil cover over the concrete roof. The comfort provided for the few occupants is also unusual. The sophisticated design of the air raid shelter suggests a British influence. It was later shown that the extra effort and cost of elaborate subterranean concrete shelters was not justified by a corresponding improvement in protection. The shelter remains surprisingly intact.

There is added significance in the association through the engineer, Isaacs, with the earliest official concern about home defence. Isaacs was a member of a sub-committee formed by the Royal Victorian Institute of Architects and the Institution of Engineers, Australia, Melbourne division. The two bodies had been asked to prepare a series of reports to the State Emergency Council for Civil Defence early in 1940.

Veterans Description for Public

The St Kilda Air domestic air raid shelter was designed by the engineer David V Isaacs for the Sicree family in February 1941, when, following the bombing of Rotterdam and the fall of France in June 1940, precautions against air attack were being investigated in Victoria. The builders were Pollard Brothers.

The Sicree shelter is not typical of those structures commonly constructed in great numbers by citizens in their backyards after 1941. The shelter is far more elaborate and costly than the subsequent local examples, and is of reinforced concrete with a barrel-vaulted ceiling, escape hatch in the toilet compartment, hand basin, three bunks, two folding benches, and food containers. The level of comfort provided in the design for the few occupants, also makes it unusual. The sophisticated design of the air raid shelter suggests a British influence. It was later shown that the extra effort and cost of elaborate subterranean concrete shelters was not justified by a corresponding improvement in protection. The shelter remains surprisingly intact.

There is added significance in the association through the engineer, Isaacs, with the earliest official concern about home defence. Isaacs was a member of a sub-committee formed by the Royal Victorian Institute of Architects and the Institution of Engineers, Australia, Melbourne division. The two bodies had been asked to prepare a series of reports to the State Emergency Council for Civil Defence early in 1940.

Extent of Registration

The air raid shelter structure and fittings and the whole of the land described in Certificate of Title Vol. 4489 Folio 800, but excluding all other improvements.

This place/object may be included in the Victorian Heritage Register pursuant to the Heritage Act 2017. Check the Victorian Heritage Database, selecting 'Heritage Victoria' as the place source.
