

## Yarraville SEC Terminal Station

HO130 - Yarraville SEC  
Terminal Station, 308 Hyde  
Street, Yarraville.JPG

### Location

Vockler St and 308 Hyde Street YARRAVILLE, Maribyrnong City

### Municipality

MARIBYRNONG CITY

### Level of significance

Included in Heritage Overlay

### Heritage Overlay Numbers

HO130

### Heritage Listing

Maribyrnong City

### Statement of Significance

Last updated on -

The Terminal Station at Yarraville is of historical, technological and architectural significance.

The site is of historical and technological significance for being the first Terminal Station established in Melbourne in the early 1920's by the newly formed State Electricity Commission (SEC) and for its provision of electrical power from the Latrobe Valley brown coal deposits. The creation of the Latrobe Valley brown coal electricity

generation scheme and the SEC was a major step in the development of Victoria, having ramifications for industry, employment and quality of life throughout Melbourne.

The Terminal Station is also of historical significance for its association with Sir John Monash who was the first chairman of the SEC and one of the main proponents behind the development of Victoria's brown coal electricity generation.

Architecturally the Machine Hall is significant as one of the earliest remaining SEC buildings in the State. Its functional, yet monumental and classically inspired form, is typical of many large scale government works and initiatives in Victoria. The building is also a prominent element of the site, with visibility from the surrounding area. The Machine Hall is of additional interest for being associated with the work of the Reinforced Concrete and Monier Pipe Construction Co. Internally, the main building is relatively intact with original crane gantry, crane and some electrical installations contributing to the significance.

The laboratory buildings are of interest architecturally, although this aspect of significance (and their technological significance) has been greatly diminished through internal changes. The toilet/amenities block is of interest as a surviving early element on the site. The remains of the original entrance road off Globe Street and associated turning circle and oval area to the north of the Machine Hall, and the Vockler Street entrance gates are significant landscape elements.

## Physical Description 1

The Yarraville Terminal Station comprises a complex of rendered brick and concrete buildings and timber and iron sheds which were constructed from 1921 onwards. Electricity was supplied to Melbourne from the site from June 1923. The earliest elements of the site are the Machine Hall, switchyard, a workshop and smaller buildings such as the amenities block. The entrance to the Terminal Station appears to have originally been off Globe Street to the north of the Machine Hall. A later addition to the complex, a large laboratory, was constructed in around 1938.

The Machine Hall, which was constructed in 1921/22, is a relatively intact large two/three storey, steel reinforced concrete structure of classically-inspired form with regular fenestration, a prominent hipped roof and overhanging eaves. Two story annexes flank parts of the southern, western and northern sides of the hall. The principal elevation is the northern, more detailed, facade which features a small formal portico entrance facing the raised grassed area in the centre of the turning circle. The ground floor comprises the machine room, which retains some original tiled floor areas, high voltage testing equipment and a crane gantry, and the adjacent annexe areas dedicated to workshops and equipment storage spaces, a battery room and switchboard room. The first floor at the west end of the building comprises the original control room and stores and offices.

The current and former laboratory buildings, which were constructed in the late 1930's and after, and which were subsequently extended and altered, are located to the north and south of the current entrance road off Hyde Street.

The toilet/amenities block is a single storey interwar building with rendered masonry and a hipped iron roof, sited to the east of the Machine Hall. The building is thought to be contemporary to early development on the site.

The significant landscape elements are:

- . The form of the original entrance road off Globe Street and associated turning circle and raised oval grassed area to the north of the Machine Hall.
- . The entrance and associated gates off Vockler Street in use since 1950, including the double iron gates which may have been relocated from the original Globe Street entrance.

Additional Report from: Maribyrnong Industrial Heritage Places, Panel Report, Amendment C31, May 2004, Gary Vines

1.1 SEC Terminal Station Hyde Street

HO 130 Submission 15 & 15a

The owners' submission (SPI PowerNet Pty Ltd and AGL) requested clarification of the application of the Heritage Overlay. They also commissioned a heritage appraisal by Allom Lovell and Associates which generally found that the site did have heritage significance and concurs with the historical, technological and architectural significance.

Some corrections were made as a result of the new information including the reference to the site by its address at 308 Hyde Street, rather than 3 Globe Street.

AGL raised several concerns: that repairs to switch gear are not likely to utilise the same materials as the original. Repairs or maintenance can be urgently required and wished to have defined, what is exactly to be included in the "Internal Controls" in the overlay.

The inspection and Allom Lovell report confirms the significance of this site. The main Machine Hall still the core of the proposed overlay but having looked more closely at the other buildings and their history, I believe a more appropriate overlay would include the Machine Hall and at least the main facades of the office/laboratory buildings, as well as the gates, driveway and amenity block. I have considered the switching yards before, but the difficulty in discerning early fabric in such a structure make inclusion in the overlay problematic.

The heritage appraisal commissioned by SPI PowerNet and carried out by Allom Lovell & Associates has found that the significant site components are:

- . The Machine Hall, to the extent of its original external and internal fabric. The original remnant electrical equipment is also of significance.
- . The former laboratory buildings on the north and south of the current entrance road, including the former garage (but not including the FAF workshop building), to the extent of their original fabric.
- . The toilet/amenities block (original external fabric)
- . The form of the original entrance road off Globe Street (not including that portion of the road and entrance which as been built over), and associated turning circle and raised oval grassed area to the north of the Machine Hall.
- . The entrance and associated gates off Vockler Street.

Recommendation: That the overlay should be altered to accurately reflect the contributory components at the site and that the internal controls apply to "the switch gear control panels and original crane".

That an incorporated plan be prepared to provide a permit exemption for works on the components covered by internal controls other than for a major upgrade, demolition or removal of the control panels or crane.
